

ACM SIGSPATIAL '26 DEMO PAPER

En-AgentSociety

Observable and reproducible LLM-based urban simulation at regional scale.

Built on an improved fork of AgentSociety.

CONTRIBUTIONS

Everything needed for rigorous urban LLM simulation

Observability & Fault Tolerance

Full prompt-response logging, LGTM stack, ClickHouse/DuckDB backend. Long-running simulations can be paused, debugged, and safely resumed without data loss.

Empirical Validation

20+ mobility metrics with interactive ECDF plots: spatial laws, temporal patterns, behavioral profiles, semantic activity distributions — validated against real-world datasets.

Scalable Regional Generation

Optimized MOSSTool pipeline with spatial indexing and batch processing. 2× faster, lower memory — demonstrated on the Greater Paris metropolitan area at regional scale.

Open-Source CitySim & Routing

CitySim re-implemented from published descriptions, integrated into the same artifact. Car-based traffic routing re-opened to enable future multi-modal simulation research.
